

Creating Project Folder

ShopEZ E-commerce Application Setup

Follow these steps to initialize the core directory structure for the ShopEZ Full Stack Development project:

Step 1: Create a new main folder for your project on your computer (e.g., SHOPEZ-Project).

Step 2: Open that newly created folder.

Step 3: Inside the main folder, create a new subfolder and name it **client** (this will hold the frontend React application).

Step 4: Create a second subfolder next to it and name it **server** (this will hold the backend Node/Express application).

Step 5: Now, open the main root folder in **VS Code** (Visual Studio Code).

Expected VS Code Explorer View

Once opened in VS Code, your file explorer should look like this:

EXPLORER

```
v SHOPEZ-PROJECT (Root Folder)
  > client
  > server
```
